✦ Watch the Work · Free workbook

The AI Employee Map.

Find the first job an AI agent can take off your team: which step, what it needs to connect to, and where a person approves the work.

30–45 minutes | One workflow | No patient data needed

An AI employee is…
An AI agent with one job, like confirming appointments or prepping prior auths.

It works inside…
The systems you already use: your EMR, phones, billing, fax and portals.

A person still…
Reviews and approves the work before it counts. The agent drafts; your team decides.

01 Pick one workflow that eats time every day

Appointment confirmations, referral intake, prior auths, denials, patient messages, eligibility checks. Write what starts it and what "done" means.

02 Watch it happen once, then map the steps (page 2)

Sit with the person who does it. One column per step: who does it, which system they touch, and how long it takes.

03 Mark the steps an agent could take

Use the agent-ready check on page 3. Repetitive, rule-based steps with digital inputs are the best first jobs.

04 Choose your first AI employee

Pick the one step that saves the most time and is easy to approve. Write down what it connects to and who signs off.

Three rules for a first AI employee

- **One agent, one job.** Start narrow. A small win your team trusts beats a big project nobody uses.
- **A person approves the work.** Decide up front where your team reviews what the agent did.
- **It lives where the work lives.** If it doesn't connect to your EMR, phones or billing, it's just another tab.

✦ Step 02–03 · Map it

Map the workflow. *Find the agent's job.*

One column per step, left to right, as it really runs today. Then mark which steps an agent could do, and where a person should approve.

WORKFLOW _____ STARTS WHEN… _____ DONE WHEN… _____

Step	1	2	3	4	5	6
What happens verb + object						
Who does it role, not name						
System it touches EMR, phone, fax, billing, portal, paper						
Minutes per day roughly						
Could an agent do it? see page 3	☐ Yes ☐ Partly ☐ No	☐ Yes ☐ Partly ☐ No	☐ Yes ☐ Partly ☐ No	☐ Yes ☐ Partly ☐ No	☐ Yes ☐ Partly ☐ No	☐ Yes ☐ Partly ☐ No
Who approves? if an agent does it						

MY FIRST AI EMPLOYEE: _____ **CONNECTS TO:** _____ **APPROVED BY:** _____ **HOURS BACK / WEEK:** _____

Best first job = most minutes per day × "Yes" × easy to approve. ★ Circle the one step you'd hand to an agent first.

✦ Step 03 · Is it agent-ready?

Five questions. *Tick what's true.*

Run this on each step you're unsure about. Four or five ticks: an agent can take it. Two or three: fix the process first, then add the agent. Zero or one: keep it human.

AGENT-READY CHECK

Could an AI employee do this step?

- [ ] It happens many times a day, mostly the same way.
- [ ] The input is digital, or could be: a call, text, fax, PDF, form or EMR field.
- [ ] Someone could explain the rules in an afternoon.
- [ ] A person can check the result before it matters.
- [ ] It can run inside the systems the team already uses.

WHAT IT WOULD CONNECT TO

Circle the systems this step touches

EMR / EHR · EMR scheduling · Phones · Text / WhatsApp · Fax · Billing / practice management · Clearinghouse · Payer portals · Patient portal · RIS / PACS · Email · Spreadsheets

Planning needs no patient data and no access to your systems. When an agent goes live, it's built under a BAA.

✦ AI agents teams start with

Front desk and access

- Bilingual front desk (phone, text, WhatsApp)
- Scheduling and no-show recovery
- Referral intake
- Insurance eligibility checks
- Patient intake forms

Revenue cycle

- Prior-auth prep
- Medical coding assistant
- Claim checks before submission
- Denial follow-up and appeal letters
- Patient billing questions

Clinical support

- Visit note drafting
- Patient message inbox drafts
- Test result follow-up tracking
- Care-gap outreach

Data and integration

- HL7 and FHIR message transformation
- Interface mapping and monitoring
- Data migration and cleanup
- Reports and dashboards

Coverage and compliance

- Medicaid coverage keeper
- Provider credentialing and license tracking
- Audit and policy document prep

Imaging and specialty

- Worklist routing
- Report quality checks
- Critical result notifications

START SMALL, SCALE WITH NYMBL

Most teams start with one AI employee doing one job. When you're ready for more, my team at Nymbl builds the big pieces: full platforms, EMR and HL7 integrations, and replacing rented software you've outgrown. That's how VytalMed grew to 3M+ reads a year.

✦ Worked example

Appointment confirmations *and no-shows.*

A typical front desk workflow, mapped. Your steps will differ; the pattern usually doesn't.

1 · Pull tomorrow's list
Export the schedule from the EMR.
Agent

2 · Call every patient
Phone calls, voicemails, call-backs.
Agent

3 · Handle changes
Cancellations and reschedules.
Agent drafts

4 · Fill open slots
Offer them to the waitlist.
Agent

5 · Approve the schedule
Final check before it's set.
Front desk

FIRST AI EMPLOYEE

Scheduling and no-show recovery

CONNECTS TO

The EMR's scheduling, phones and texting

A PERSON APPROVES

The front desk reviews changes before they're saved

WHAT THE TEAM GETS BACK

The morning calling block goes to the agent. Staff handle only the exceptions it flags, and the waitlist fills open slots the same day.

AGENT-READY: 5 / 5

High volume, digital inputs, clear rules, a person approves before it counts, and it runs inside the EMR's scheduling and the phone system.

Illustrative example based on common patterns, not a specific client.

✦ Your turn

Get your first AI employee *built free.*

Tell me your workflow in a sentence or two. The agent finder suggests which agent fits and what it would connect to. Then I build a working version around your real workflow, free. No connection to your systems, no patient data.
